BMD & DXA

DXA physics

DXA physics

More dense

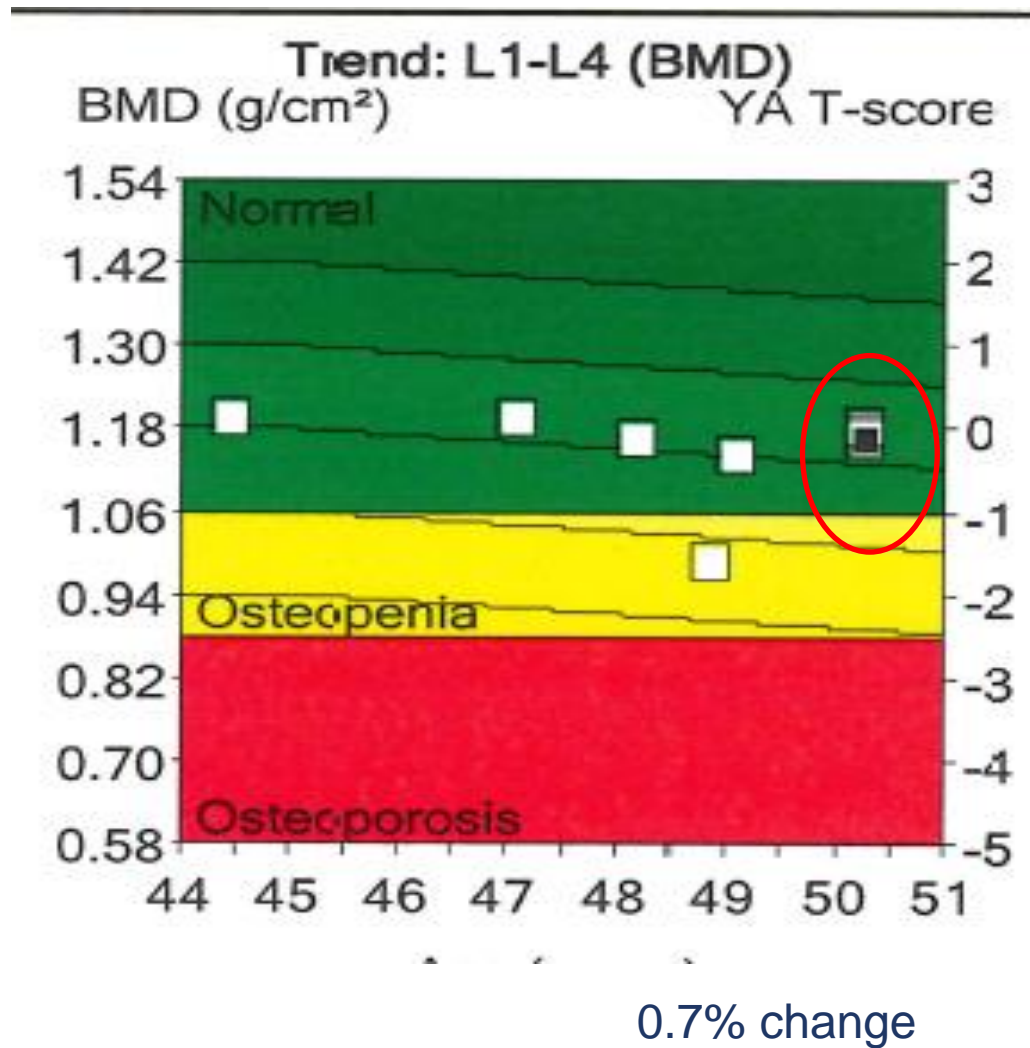

Less dense

Measurement date	BMD g/cm2	% change against previous
19.04.2019	1.172	0.4
19.04.2019	1.167	0.3
19.04.2019	1.163	-0.2
19.04.2019	1.165	-0.2
19.04.2019	1.167	-0.3

Precision

Measurement date	BMD g/cm2	% change against previous
19.04.2019	1.188	-0.3
18.04.2019	1.192	-0.3
15.04.2019	1.196	0.6
14.04.2019	1.189	0.8
13.04.2019	1.180	-0.2

1.1% change over 5 samples

Rates of Change

Least significant change:

The least significant change is the minimum change in BMD between two scans on the same individual that indicate a real increase or decrease in BMD.

It is calculated as 2.77 times the long-term **precision** error (co-efficient of variation) of the Equipment ⁽³⁾

Rates of change

Long term precision errors- in a clinical cohort- for lumbar spine and total femur

$$\text{BMD} = 1.6\%_{(4)}$$

$$\text{LSC in clinical practice} = 4.5\%$$

Pitfalls

- **Precision errors can be increased by:**
- many operators/not following tight protocols- poor positioning for scans
- Equipment drift
- Patient condition
- Obesity
 - Spine – inhomogeneity
 - Hip – fat panniculus

Pitfalls

- **Precision errors can be increased by:**
- many operators/not following tight protocols- poor positioning for scans
- Equipment drift
- Patient condition
- Obesity
 - Spine – inhomogeneity
 - Hip – fat panniculus

Best Practice- positioning

- Centre laser 5cm superior to the ASIS in the patients midline
 - To start in the body of L5

Best Practice- positioning

Scan ends in the body of T12

There are important reasons for this in the calculation of soft tissue values in GE scanners *

Scan starts in the body of L5

Spine is straight and central in the field of view

There may be:

- rib identified at T12
- Iliac crest identified adjacent to L4/5

* And IR(ME)R implications with 'optimization'

Region	BMD g/cm ²
L1-4	0.940

Region	BMD g/cm ²
L1-4	0.964

Identifying L5:

Understanding
projectional
anatomy:

- Spinus processes
- Facet joints
- Transverse processes
- Sacro-iliac joint

Good and poor positioning

Best Practice- positioning

Best Practice- positioning

- Abduct leg approx. **15°FROM THE MIDLINE**. Femur parallel to the long axis of the table
 - To separate ischium from lesser trochanter
- Internally rotate the leg 25°– The whole leg is rotated **FROM THE HIP** keeping knee straight
 - Femoral neck parallel to table
 - Moves greater trochanter anteriorly and lesser trochanter posteriorly
- **Centring:** 5cm below the greater trochanter (15cm below ASIS) and in the midline of the femur.

Best Practice- positioning

Best Practice- analysis

- **Bone map**
- **Nomenclature**
- **IVM**

Best Practice- analysis Identifying intervertebral levels

Best Practice- analysis

False IVM sign

Best Practice- analysis

Best Practice- analysis-nomenclature

Region	BMD g/cm2	T-score
L1-L4	0.963	-2.1

Region	BMD g/cm2	T-score
L1-L4	1.029	-1.6

Best Practice- analysis

Exclusion of vertebral levels - 1

o ISCD Official positions 2015- vertebral exclusions:

o **EXCLUDE WHEN:**

1) Visible focal structural defects

- Vertebral fractures
- OA/Degenerative and sclerotic changes
- Artefacts

Best Practice- analysis

Ironmongery – exclude effected levels

Spinal fusion

Harrington rods

Best Practice- analysis

Exclusion of vertebral levels- 2

o ISCD Official positions 2015- vertebral exclusions:

o **EXCLUDE WHEN:**

2) There is a **>1SD T-score** discrepancy between adjacent vertebrae **AND** evidence of sclerotic defect on the image

- **Exclude all vertebrae with the defects and the higher BMD**
- Leads to improvement in fracture prediction
- Min 2 levels required to base a diagnostic statement.

Best Practice- analysis

Region	BMD g/cm2	T-score
L1	0.976	-1.5
L2	1.033	-1.7
L3	1.007	-1.9
L4	1.636	3.3

Region	T-score
L1-4	-0.4
L1-3	-1.7

AP Spine Bone Density

AP Spine Bone Density

Best Practice- analysis ST artefacts

- Management of artefacts GE lunar scanners:

Artefact	Action
Soft tissue only	Point type as artefact assigning a neutral value
Over bone	Exclude the vertebra

Best Practice- analysis

ST artefacts

HOLOGIC Management of artefacts:

Artefact	Management	Effect on measurements
Soft tissue only	Use 'UNDO' at bone map	none
Over bone/vertebral body	Delete vertebra	None- caution with rates of change
Over soft tissue & bone	Delete vertebra	none
Small artefact in soft tissue e.g. clips, catheter	none	Little or none
Small artefact over bone e.g. clips, belly bar/ring	If abnormal- delete bone	Small effect
Large artefact over soft tissue	none	Possible effect- interpret with caution
Large artefact over soft tissue and bone	Delete vertebrae or exclude from global ROI	Definite effect- interpret with caution.

Reducing precision errors: Standardising Practice

HOW??

- Protocols
- Training
- Competency
- Audit

Standardising Practice

- **Protocols**

- should cover aspects that are legislated for under IR(ME)R
- should include clear work instructions that describe what areas are scanned and how this is done
- should include what correct positioning and analysis look like

Standardising Practice

- Training

- Operators and those analysing scans should have specific training
- Should be manufacturer specific
- Should be competency tested

Standardising Practice

- Competency
 - Defines scope of practice
 - Specific and detailed
 - Standardises practice
 - Should be reviewed regularly

Audit

- **Audit** of scan and analysis technique
 - Evidences competency
 - Benchmark service quality and effectiveness
 - Un-masks common lapses in technique or factors effecting precision

Audit

What?

Have we learned?

- Precision- least significant change
- Best practice in positioning and analysing spine and hip DXA
- Importance standardisation in precision
- Steps towards standardised best practice

Questions & discussion
